

About the property

This 83-acre property, permanently protected in 2017 as a nature preserve, includes one of Wisconsin's longest natural cavern systems and provides hibernacula for three species of bats (see next panel). The land provides valuable habitat including native remnant prairie, limestone cliffs and rock outcrops, oak savanna, and oak-hickory forests.

The rich, mature oaks on the property provide habitat for the state-threatened cerulean warbler, observed nesting on the site in 2016. Birders can also enjoy populations of scarlet tanagers, blue-winged warblers, yellow-billed cuckoos, and melodious wood thrushes. The prairie and savanna are home to the prairie ringneck snake, a state-listed species of "Special Concern."

The site will be utilized for education and research, providing opportunities for school groups to learn about area bat populations, geology, and natural history.

The previous owners, Delores and Ray Gaidowski, and their daughter, Carole Gaidowski Porter, were committed to ensuring the land and cavern were cared for. According to Carole, her mother "asked me time and again to please keep the property in its natural state. An answer to all my family's prayers came when I was introduced to Mississippi Valley Conservancy. Being the last steward of my family's property, I can now rest assured that my parents' final wishes will indeed be granted."

Activities allowed

There are no trails, but the property is open for hiking, hunting, birding, and cross-country skiing

Activities NOT allowed

Biking, motorized vehicles, caving, and spelunking

Please respect landowners near Conservancy tracts by observing property boundaries.

About the cavern and the bats

The site was a commercial show cave for over 60 years and was used by area schools, tourists, and residents. The cavern, which maintains a constant 48 degrees year-round, will be available for public viewing **only through guided tours during spring and summer** (not during bat hibernation, October 1–May 15).

Bats are a vital part of our ecosystem, eating up to an estimated 1,200 mosquitos per hour, and Kickapoo Caverns is a *hibernaculum* (winter hibernating quarters) for three species: the federally threatened northern long-eared bat and the state-threatened little brown bat and eastern pipistrelle. The site's location—near the Wisconsin and Mississippi Rivers—has regional significance because the rivers are used as bat migration corridors.

For information on cavern tour dates, become a member of the Conservancy (mississippivalleyconservancy.org/get-involved/membership).
