

About the property

This 83-acre property, permanently protected in 2017 as a nature preserve, includes one of Wisconsin's longest natural cavern systems and provides hibernacula for three species of bats (see next panel). The land provides valuable habitat including native remnant prairie, limestone cliffs and rock outcrops, oak savanna, and oak-hickory forests.

The rich, mature oaks on the property provide habitat for the state-threatened cerulean warbler as well as populations of scarlet tanagers, blue-winged warblers, yellow-billed cuckoos, and wood thrushes.

The site will be used for education and research, providing opportunities for school groups to learn about area bats, geology, and natural history.

The previous owners, Delores and Ray Gaidowski, and their daughter, Carole Porter, were committed to ensuring the land and cavern were cared for. According to Carole, her mother "asked me time and again to please keep the property in its natural state."

Acquisition of the Kickapoo Caverns property was funded in part by Knowles-Nelson Stewardship Fund, Paul E. Stry Foundation, John C. Bock Foundation, Whitetails Unlimited, Clif Bar Family Foundation, Wisconsin Land Fund, and Crawford County Community Fund.

Activities allowed

The property is open for hiking, hunting, birding, and cross-country skiing.

Activities NOT allowed

The property is closed to pets, biking, motorized vehicles, caving, spelunking, horseback riding, camping.

Please respect landowners near Conservancy tracts by observing property boundaries.

About the cavern and the bats

The site was a commercial show cave for over 60 years and was used by area schools, tourists, and residents. The cavern, which maintains a constant 48 degrees year-round, will be available for public viewing **only through guided tours in spring and summer** (cave is closed during bat hibernation, August 15–May 15).

Bats are a vital part of our ecosystem, eating up to 1,200 mosquitos per hour, and Kickapoo Caverns is a hibernaculum (winter hibernating quarters) for three species: the federally and state-threatened northern long-eared, the state-threatened little brown, and the state-threatened eastern pipistrelle. The site's location—near the Wisconsin and Mississippi Rivers—has regional significance because the rivers are used as bat migration corridors.

For information on cavern tour dates, become a member of the Conservancy (mississippivalleyconservancy.org/get-involved/membership).
